                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Science 269:496-512(1995).

-I- FUNCTION: Seems to be involved in the anchoring of the catalytic components of the fumarate reductase complex to the cytoplasmic membrane (By similarity).

-I- SUBUNIT: Part of an enzyme complex containing four subunits: a flavoprotein (frdA), an iron-sulfur protein (frdB), and two hydrophobic anchor proteins (frdC and frdD) (By similarity).

-I- SUBCELLULAR LOCATION: Bacterial cell inner membrane; multi-pass membrane protein (By similarity).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps

Natl. Acad. Sci. U.S.A. 100:581-586(2003).
-!- FUNCTION: Could be a nuclease that resolves Holliday junction intermediates in genetic recombination.
-!- SUBCELLULAR LOCATION: Cytoplasm (Potential).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       16-JUN-2003, sequence version 1.
7-MAR-2006, entry version 20.
Putative Holliday junction resolvase (EC 3.1.-.-).

The present invention relates to an isolated and purified ApoptoM peptide. The invention is useful as a vaccine for the prevention and readement of pathological conditions from non-specific febrile illnesses to severe hemorrhagic manifestations, encephalitic syndromes and these pathological conditions are linked to Plavivirus infection or cancers. The invention is also useful in gene therapy. The present sequence is a p(95-114) EGFP (enhanced green fluorescent protein) (MI-M40) DEN (dengue) -2 (136F) plasmid DNA encoded protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New isolated and purified ApoptoM peptide comprises 9 amino acids, useful as a vaccine for preventing or treating pathological conditions from nonspecific febrile illnesses to severe hemorrhagic manifestations or encephalitic syndromes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gene therapy, protein purification; virucide; cytostatic; vaccine; hemorrhage; bleeding; infection; flavivirus infection; neoplasm; cancer; DEN; dengue; mutant; mutein.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present invention relates to an isolated and purified ApoptoM peptide. The invention is useful as a vaccine for the prevention and treatment of pathological conditions from non-specific febrile illnesses to severe hemorrhagic manifestations, encephalitic syndromes and these pathological conditions are linked to Flavivirus infection or cancers. The invention is also useful in gene therapy. The present sequence is a M1-40/DBN (dengue)-2 (P36) mutant protein.
                                                                                                                                                                                                                                                                                                                                                                                                    Gene therapy; protein purification; virucide; cytostatic; vaccine; hemorrhage; bleeding; infection; flavivirus infection; neoplasm; cancer; DEN; dengue; mutant; mutein.

                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                              New isolated and purified ApoptoM peptide comprises 9 amino acids, useful as a vaccine for preventing or treating pathological conditions from non-specific febrile illnesses to severe hemorrhagic manifestations or encephalitic syndromes.
                                                                                                                                                                                                                                                                                                    The present invention relates to an isolated and purified ApoptoM peptide. The invention is useful as a vaccine for the prevention and treatment of pathological conditions from non-specific febrile illnesses to severe hemorrhagic manifestations, encephalitic syndromes and these pathological conditions are linked to Flavivirus infection or cancers. The invention is also useful in gene therapy. The present sequence is a M32-40/DEN (dengue)-2 mutant protein.

purified ApoptoM peptide comprises 9 amino acids, useful preventing or treating pathological conditions from non-illnesses to severe hemorrhagic manifestations or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New isolated and purified ApoptoM peptide comprises 9 amino acids, useful as a vaccine for preventing or treating pathological conditions from nonspecific febrile illnesses to severe hemorrhagic manifestations or
                                                                                                                                                                                                                                                                                                             The present invention relates to an isolated and purified ApoptoM peptide. The invention is useful as a vaccine for the prevention and treatment of pathological conditions from non-specific febrile illnesses to severe hemorrhagic manifestations, encephalitic syndromes and these pathological conditions are linked to Plavivirus infection or cancers. The invention is also useful in gene therapy. The present sequence is a M20-40/DEN (dengue)-2 mutant protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention relates to an isolated and purified ApoptoM peptide. The invention is useful as a vaccine for the prevention and treatment of pathological conditions, from non-specific febrile illnesses to severe hemorrhagic manifestations, encephalitic syndromes and these pathological conditions are linked to Flavivirus infection or cancers. The invention is also useful in gene therapy. The present sequence is a MIO-40/DEN (dengue)-2 mutant protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gene therapy, protein purification, virucide, cytostatic, vaccine, hemorrhage, bleeding, infection, flavivirus infection, neoplasm, cancer,

                                                                                                                                                                                                                                                                                                                                                                                                      The present invention relates to an isolated and purified ApoptoM peptide. The invention is useful as a vaccine for the prevention and treatment of pathological conditions from non-specific febrile illnesses to severe hemorrhagic manifestations, encephalitic syndromes and these pathological conditions are linked to Flavivirus infection or cancers. The invention is also useful in gene therapy. The present sequence is a M1-40/DEN (dengue)-2 protein.

The invention relates to pro-apoptotic fragments of the Dengue virus (DEN) pRM and E glycoproteins, methods for screening molecules capable of inducing apoptosis in a cell. The invention particularly relates to DEN-1 M (a membrane protein anchored in envelope surrounding the nucleocapsid of the virus) ectodomain sequence, Den-1-C amino acid sequence and DEN-2 M ectodomain sequence. Sequences of the invention are useful for inducing apoptosis in a cell of a partient suffering from cancer or flavivirus infection. They are also useful for screening molecules which inhibit apoptosis. The present sequence is DEN-2 virus M ectodomain. (Updated on 29-AUG-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gene therapy; protein purification; virucide; cytostatic; vaccine; hemorrhage; bleeding; infection; flavivirus infection; neoplasm; cancer; YF; yellow fever; mutant; mutein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Σ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Novel apoptosis inducing polypeptide fragments of Dengue virus-1 or 2 protein, useful for inducing apoptosis in a cell of a human patient suffering from cancer or flavivirus infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps

                                                                                                                                                                                                           New isolated and purified ApoptoM peptide comprises 9 amino acids, useful
                                                                                                                                                                                                                                         for preventing or treating pathological conditions from non-
rile illnesses to severe hemorrhagic manifestations or
                                                                                                                                                                                                                                                                                                                                                                                                         The present invention relates to an isolated and purified ApoptoM peptide. The invention is useful as a vaccine for the prevention and treatment of pathological conditions from non-specific febrile illnesses to severe hemorrhagic manifestations, encephalitic syndromes and these pathological conditions are linked to Plavivirus infection or cancers. The invention is also useful in gene therapy. The present sequence is a M1-40/YF (yellow fever).17D (T34, I36, I37, H39) mutant protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Novel apoptosis inducing polypeptide fragments of Dengue virus-1 or 2 M protein, useful for inducing apoptosis in a cell of a human patient
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Dengue virus, pRM glycoprotein, E glycoprotein, apoptosis, virucide, cancer, flavivirus infection, cytostatic, EGFP, DEN-2 protein, enhanced green fluorescent protein, fusion protein, M ectodomain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Ä

(DEN) pRM and Eglycoproteins, methods for screening molecules capable of inducing apoptosis and methods of inducing apoptosis in a cell. The invention particularly relates to DEN-1 M (a membrane protein anchored in cenvelope surrounding the nucleocapsid of the virus) ectodomain sequence. Den-1-C amino acid sequence and DEN-2 M ectodomain sequence. Sequences of the invention are useful for inducing apoptosis in a cell of a patient suffering from cancer or flavivirus infection. They are also useful for screening molecules which inhibit apoptosis. The present sequence is (95-114) EGFP(206-245)DEN-2 fusion protein construct. This construct comprises 95-114 of the C-terminus of the C-protein of the DEN-1 virus strain BR/90 fused to the N-terminus of enhanced green fluorescent protein (EGFP) and DEN-2 virus strain Jamaica M ectodomain (DEN-2 polyprotein) fused to the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to a novel recombinant or synthetic polypeptide comprising an amino acid sequence that has at least about 90% sequence identity to any of the 20 fully defined amino acid sequences given in the specification. The polypeptide of the invention demonstrates virucide activity and may be useful for inducing an immune response to altaviviruses (arboviruses group B), including Dengue viruses, as well as in detecting and/or diagnosing the presence of antibodies against the Dengue virus serotypes in a sample and for gene therapy. The current
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New recombinant or synthetic polypeptides and polynucleotides useful for diagnosing, preventing or treating diseases associated with flaviviruses, including dengue viruses.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     virucide; Flavivirus; arboviruses group B; gene therapy; truncated prM;

The invention relates to a novel recombinant or synthetic polypeptide comprising an amino acid sequence that has at least about 90% sequence identity to any of the 20 fully defined amino acid sequences given in the specification. The polypeptide of the invention demonstrates virucide activity and may be useful for inducing an immune response to Plaviviruses (arboviruses group B), including Dengue viruses, as well as in detecting and/or diagnosing the presence of antibodies against the Dengue virus serotypes in a sample and for gene therapy. The current antigen fusion protein of the invention which comprises the C-terminal 15 amino acids of the cappid protein fused to a truncated form of the protein lacking the C-terminal 15 amino acids.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                            ö
sequence is that of a Dengue virus C15/truncated prM antigen fusion protein of the invention which comprises the C-terminal 15 amino acids of the capsid protein fused to a truncated form of the prM protein lacking the C-terminal 15 amino acids.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New recombinant or synthetic polypeptides and polynucleotides useful for diagnosing, preventing or treating diseases associated with flaviviruses, including dengue viruses.

The invention relates to a novel recombinant or synthetic polypeptide comprising an amino acid sequence that has at least about 90% sequence identity to any of the 20 fully defined amino acid sequences given in the specification. The polypeptide of the invention demonstrates virucide activity and may be useful for inducing an immune response to Plaviviruses (arboviruses group B), including Dengue viruses, as well as in detecting and/or diagnosing the presence of antibodies against the Dengue virus serctypes in a sample and for gene therapy. The current sequence is that of a Dengue virus C15/truncated prM antigen fusion protein of the invention which comprises the C-terminal 15 amino acids of the capsid protein fused to a truncated form of the protein last to a truncated form of the prim protein last the capsid protein acids of the prim protein acids of the prim protein last the C-terminal 15 amino acids of the prim protein lacking
                                                                                                                                                                                                                                                                                                                                                                                                                                                       New recombinant or synthetic polypeptides and polynucleotides useful for diagnosing, preventing or treating diseases associated with flaviviruses, including dengue viruses.

                                                                                                                                                                                                                                                                                                               Vazquez Ramudo S, Guzman Tirado G, Guillen Nieto GE, Pardo Lazo OL, Chinea Santiago G, Perez Diaz AB, Pupo Antunez M, Redriguez Roche R, Reyes Accosta O, Garay Perez HE, Padron Palomares G, Alvarez Vera M; Morier Diaz L, Perez Insuita O, Pelegrino Martinez De La Coterri Pedro,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       This protein represents a fusion protein comprising an M protein epitope from Dengue virus type 2 inserted into the P64K protein from Neisseria meningitidis. Synthetic peptides based on the Dengue virus epitope sequences (AAW75404-W75408) and fusion proteins can be used to raise antibodies. The peptides, protein and antibodies are all useful for diagnosis and treatment of Plavivirus infection, e.g. in vaccines. (Updated on 25-WAR-2003 to correct PI field.) (Updated on 17-OCT-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                                                                                                                                      New peptide(s) and fusion proteins useful for diagnosis and treatment of flavivirus infection - contain cross-reactive epitopes from Dengue virus pre-M/M protein and can induce neutralising antibodies.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Dengue virus C15/prM/E part codon-optimised antigen fusion protein 2.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps

The invention relates to a novel recombinant or synthetic polypeptide comprising an amino acid sequence that has at least about 90% sequence identity to any of the 20 fully defined amino acid sequences given in the specification. The polypeptide of the invention demonstrates virucide activity and may be useful for inducing an immune response to Plaviviruses (arboviruses group B), including Dengue viruses, as well as in deciring an experience of antibodies against the Dengue virus serotypes in a sample and for gene therapy. The current sequence is that of the Dengue virus (SIS/prM/E partially human codonoptimised antigen fusion protein of the invention which comprises 15 codonoptimised prM protein and envelope (E) protein.
                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New recombinant or synthetic polypeptides and polynucleotides useful for diagnosing, preventing or treating diseases associated with flaviviruses,

```
The invention relates to a novel recombinant or synthetic polypeptide comprising an amino acid sequence that has at least about 90% sequence identity to any of the 20 fully defined amino acid sequences given in the specification. The polypeptide of the invention demonstrates virucide activity and may be useful for inducing an immune response to plaviviruses (abpoviruses group B), including Dengue viruses, as well as in detecting and/or diagnosing the presence of antibodies against the Dengue virus serviypes in a sample and for gene therapy. The current esquence is that of the Dengue virus c15/prm/E antigen fusion protein of the invention which comprises 15 amino acids of the capaid (c) protein fused to the full-length prM protein and envelope (E) protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New recombinant or synthetic polypeptides and polynucleotides useful for diagnosing, preventing or treating diseases associated with flaviviruses, including dengue viruses.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        virucide; Flavivirus; arboviruses group B; gene therapy; C15/prM/E; prM;

The polypeptide of the invention demonstrates virucide activity and may be useful for inducing an immune response to plavaviruses (arboviruses group B), including Dengue viruses, as well as in detecting and/or diagnosing the presence of antibodies against the Dengue virus serotypes in a sample and for gene therapy. The current sequence is that of the Dengue virus (15/prM/E) partially human codonoptimised antigen fusion protein of the invention which comprises 15 amino acids of the capsid (C) protein fused to the full-length partially codonoptimised prM protein and envelope (E) protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New recombinant or synthetic polypeptides and polynucleotides useful for diagnosing, preventing or treating diseases associated with flaviviruses,
                                                                                            Dengue virus C15/prM/E part codon-optimised antigen fusion protein 1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps

```

The invention relates to a novel recombinant or synthetic polypeptide comprising an amino acid sequence that has at least about 90% sequence identity to any of the 20 fully defined amino acid sequences given in the specification. The polypeptide of the invention demonstrates virucide activity and may be useful for inducing an immune response to altavirintess (arboviruses group B), including Demogue viruses, as well as in detecting and/or diagnosing the presence of antibodies against the Demogue virus serotypes in a sample and for gene therapy. The current the invention which comprises 15 amino acids of the capsid (C) protein of tused to the full-length prM protein and envelope (B) protein.

Sequence 675 AA;

The invention relates to a novel recombinant or synthetic polypeptide comprising an amino acid sequence that has at least about 90% sequence identity to any of the 20 fully defined amino acid sequences given in the specification. The polypeptide of the invention demonstrates virucide activity and may be useful for inducing an immune response to plaviviruses (arboviruses group B), including Dengue viruses, as well as in detecting and/or diagnosing the presence of antibodies against the Dengue virus serotypes in a sample and for gene therapy. The current sequence is that of the Dengue virus c15/prm/E antigen fusion protein of the invention which comprises 15 amino acids of the cappaid (C) protein fused to the full-length prM protein and envelope (E) protein.
                                                                                                                                                                                                                                                                                                                        New recombinant or synthetic polypeptides and polynucleotides useful for diagnosing, preventing or treating diseases associated with flaviviruses including dengue viruses.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   virucide; Flavivirus; arboviruses group B; gene therapy; DEN-2;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   This protein represents a fusion protein comprising an M protein epitope from Dengue virus type 4 inserted into the P64K protein from Neisseria meningitidis. Synthetic peptides based on the Dengue virus epitope sequences (AAM75404-W75408) and fusion proteins can be used to raise antibodies. The peptides, protein and antibodies are all useful for diagnosis and treatment of Flavivirus infection, e.g. in vaccines. (Updated on 25-MAR-2003 to correct PI field.) (Updated on 17-OCT-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New peptide(s) and fusion proteins useful for diagnosis and treatment of flavivirus infection - contain cross-reactive epitopes from Dengue virus pre-M/M protein and can induce neutralising antibodies.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           virucide; Flavivirus; arboviruses group B; gene therapy; C15/prM/E; prM; envelope; capsid.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps

```
The invention relates to a novel recombinant or synthetic polypeptide comprising an amino acid sequence that has at least about 90% sequence identity to any of the 20 fully defined amino acid sequences given in the specification. The polypeptide of the invention demonstrates virucide activity and may be useful for inducing an immune response to Flaviviruses (arboviruses group B). Including Dengue viruses, as well as in detecting and/or diagnosing the presence of antibodies against the
                                                                                                                               protein.
                                                                                                                                                                                                                                                                                                                                                     11-DEC-2003.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                      The invention relates to a novel recombinant or synthetic polypeptide comprising an amino acid sequence that has at least about 90% sequence identity to any of the 20 fully defined amino acid sequences given in the specification. The polypeptide of the invention demonstrates virucide activity and may be useful for inducing an immune response to Plaviviruses (arboviruses group B), including Dengue viruses, as well as in detecting and/or diagnosing the presence of antibodies against the Dengue virus serotypes in a sample and for gene therapy. The current sequence is that of the Dengue Virus type 2 (DEN.2) Den.2C15/prw//E antigen fusion protein of the invention which comprises 15 amino acids of the capsid (C) protein fused to the full-length prM protein and envelope
  New recombinant or synthetic polypeptides and polynucleotides useful for diagnosing, preventing or treating diseases associated with flaviviruses, including dengue viruses.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New recombinant or synthetic polypeptides and polypucleotides useful for diagnosing, preventing or treating diseases associated with flaviviruses including dengue viruses.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to a novel nucleic acid comprising a transcriptional unit encoding a signal sequence of a structural protein of a first flavivirus and an immunogenic flavivirus antigen of a second flavivirus, where the transcriptional unit directs the synthesis of the antigen. The polymucleotide of the invention has virucide activity, and acts as a vaccine. A composition of the invention is useful for immunising a subject against infection by a flavivirus. The polymucleotide is useful as a vaccine for preventing flavivirus infection. The sequence represents plasmid pCBD2-14-6, which contains dengue-2 virus (DEN-2) prM and E proteins
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps

infection, comprises transcriptional unit encoding signal sequence of one flavivirus and immunogenic flavivirus antigen of a second flavivirus.
                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to a novel nucleic acid comprising a transcriptional unit encoding a signal sequence of a structural protein of a first flavivirus and an immunogenic flavivirus antigen of a second flavivirus, where the transcriptional unit directs the synthesis of the antigen. The polymucleotide of the invention has virucide activity, and acts as a vaccine. A composition of the invention is useful for immunishing a subject against infection by a flavivirus. The polymucleotide is useful as a vaccine for preventing flavivirus infection. The sequence represents plasmid pCB9D2-IJ-4-3, which contains dengue-2 virus (DEN-2) prM, M and E, and Japanese encephalitis virus E
                                                                                                                                                                                                                                                                                                     Novel isolated nucleic acid useful as vaccine for preventing flavivirus

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Novel isolated nucleic acid useful as vaccine for preventing flavivirus infection, comprises transcriptional unit encoding signal sequence of one flavivirus and immunogenic flavivirus antigen of a second flavivirus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to a novel nucleic acid comprising a transcriptional unit encoding a signal sequence of a structural protein of a first flavivirus and an immunogenic flavivirus antigen of a second flavivirus, where the transcriptional unit directs the synthesis of the antigen. The polymucleotide of the invention has virucide activity, and acts as a vaccine. A composition of the invention is useful for immunising a subject against infection by a flavivirus. The polymucleotide is useful as a vaccine for preventing flavivirus infection. The sequence represents plasmid pcBBD2-20-29-1, which contains dengue-2 virus (DEN-2) prM, M and E, and Japanese encephalitis
                                                                                                                                                                                 Flavivirus, immunogenic flavivirus antigen; virucide; vaccine; prM-E; pCB8D2-2J-2-9-1; Japanese encephalitis virus; dengue-2 virus; DEN-2.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ô
                                                                                                                                                                                                                                                                                                                     A polypeptide (AAW09409) comprises the capsid, pre-membrane, envelope and NS1 proteins of dengue virus serotype 2 (DEN-2) variant PR159/S1. A conservative mutation in the envelope protein may be involved in the attenuation of this small-plaque, temp. sensitive variant. Portions of the envelope protein, esp. domain B, can be expressed in eukaryotic hosts (see also AAW09410 and AAW0942-28) transfected with vectors incorporating DEN-2 S1 cDNA (see also AAT47666). These polypeptides can be useful insertion, to raise antibodies useful for passive immunisation, and for diagnosis of infection. (Updated on 17-OCT-2003 to standardise OS field)

```
This sequence is composed of the capsid, prM, envelope (E) and NS1
proteins of serotype 2 dengue virus DEN-2 strain PR159/61. A vaccine for
protecting against flavivirus infection comprises a dimeric 80% E protein
that has been secreted as a recombinant protein from a eukaryotic cell.
80% E indicates a C-terminally truncated flavivirus E protein. The
dimeric truncated E is formed: (1) by directly linking 2 tandem copies of
dimeric truncated E is formed: (1) by directly linking 2 tandem copies of
commain through the homodimeric association of 2 leucine zipper helices
cach fused to the C-terminus of an 80% E molecule; or (3) via the
commain of a non-covalently associated four-helix bundle domain formed
upon association of two helix-turn-helix moieties attached to the C-
terminus of an 80% E molecule. Dimeric truncated DEN-2 E proteins are
efficiently secreted by recombinant cells, are easier to purify than
intracellular proteins, and generally applicable to flaviviruses, in
cappose. The method is generally applicable to flaviviruses, in
cappose the method is generally applicable to flaviviruses amino
codids 1-395 of DEN-2 E. The products can also be used for diagnosis of
infection. (Updated on 17-OCT-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Recombinant dimeric flaviviral envelope vaccine - comprising a dimeric 80%E protein, useful for protecting against flavivirus, especially dengue virus infections.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Dengue virus; DEN-2; Envelope protein; 80% E; membrane protein; capaid protein; NS1 protein; Dengue haemorrhagic fever; DHF; Dengue shock syndrome; DSS; flavivirus; vaccine.

The invention describes a vaccine that generates a protective,

neutralising antibody response to a Flavivirus in a murine host. The

neutralising antibody response to a Flavivirus in a murine host. The

vaccine comprises a therapeutic amount of a dineric 80%E, the dimeric

80%E having been secreted as a recombinantly produced protein from

Drosophila Schneider cells, and where 80%E represents the N-terminal 80%

Drotion of the protein from residues 1-395. Also described are: an

immunogenic polypeptide comprising the dimeric 80%E cited above; an

immunogenic composition that generates a protective, neutralising

antibody response to a Flavivirus in a murine host, comprising the above

immunogenic polypeptide and a physiological carrier; a multivalent

immunogenic polypeptide of Flavivirus, comprising the above

immunogenic for the detection of Flavivirus, comprising at least 2

of the above immunogenic polypeptides of at least 2 flaviviral serotypes;

cof the above immunogenic or multivalent immunodiagnostic

cof the above immunosentic with dimeric 80%E, and

labeled antibodies immunoreactive to antibodies from the test subject.

Che composition is useful for preventing or diagnosing infections caused

by dengue virus. This is the amino acid sequence of the polyprotein

encoded by Dergue virus gene virus apsen viral capsid, prM, E and NSI genes for

bengue virus strain PRIS9/SI used as the source of EBN-2 genes for the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New vaccines for preventing or diagnosing infections caused by dengue virus comprises a therapeutic amount of a dimeric 80%E protein secreted from Drosophila Schneider cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Attenuation; growth; vaccine; infection; Dengue virus type 4.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Score 48; DB 8; Length 1127;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to a vaccine for protection against Flavivirus infection comprising a dimeric 80% envelope (B), which has been secreted as a recombinantly produced protein from Drosophila Schneider cells and which represents the N-terminal 60% portion of the protein from residue 1-395. Also included are a method for protecting a subject against a Flavivirus, an immunogenic polypeptide comprising a dimeric 80% E, an immunogenic polypeptide and a carrier, an immunodiagnostic for detecting Flavivirus comprising the immunogenic polypeptide and a carrier, an immunodiagnostic for detecting Flavivirus comprising the immunogenic polypeptide and an immunodiagnostic kit for detecting Flavivirus in a test subject. The dimeric 80% E products are envelope proteins of serotypes comprising DEN-1, DEN-2, DEN-3 or DEN-4. The proteins is a dengue virus. The 80% E products are envelope proteins of serotypes comprising DEN-1, DEN-2, DEN-3 or DEN-4. The proteins of serotypes comprising DEN-1, DEN-2, DEN-3 or DEN-4. The proteins of serotypes comprising DEN-1, DEN-2, DEN-3 or DEN-4. The incorporating a helix-turn-helix peptide, to encourage dimerisation. The vaccine is useful for protection against dengue virus infection (e.g. Dengue haemorrhagic fever, DHF, and Dengue shock syndrome, DEN-2 errore and pengue haemorrhagic fever, DHF, and Dengue shock syndrome, DEN-2 errore and pengue haemorrhagic fever, DHF, and pengue shock syndrome, DEN-2 errore and pengue haemorrhagic fever succeed by the partial genomic sequence of the DEN-2 errore and pengue the partial genomic sequence of the DEN-2 errore and pengue page the partial genomic sequence of the DEN-2 errore and pengue the partial genomic sequence of the DEN-2 errore and pengue page the partial genomic sequence of the DEN-2 errore and pengue page pengue page pengue page pengue page pengue page pengue page pengue page pengue page pengue page pengue page pengue page pengue page pengue page pengue page pengue page pengue page pengue page pengue page pengue page pengue pengue pengue

                                                                                                                                                                                                                                                                                                                         The present invention relates to novel mutated flaviviruses comprising a phenotype in which the viral genome is modified by introduction of a mutation, singly or in combination, taken from mutations from recombinant virus bearing Vero adaptation mutations, putative Vero cell adaptation mutations of dengue type 4 virus (DEM4) or mutations whown to attenuate dengue type 4 virus. The methods and compositions of the invention are useful for fine tuning the attenuation and growth characteristics of dengue virus vaccines for the prevention and/or treatment of dengue virus robenz/4delta30 protein
                                                                                                                                                                                                                        New mutated flavivirus, useful for fine tuning the attenuation and growth characteristics of dengue virus vaccines for the prevention and/or treatment of dengue virus infection.

Detection and identification of Flaviviridae in biological sample - by amplifying consensus sequence then hybridisation opt. followed by typing, e.g. sequencing amplified prod.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The dengue 2 virus is an example of a member of the Flaviviridae which can be identified using the probe pair of the invention. A species-specific sequence can be amplified using the claimed oligonucleotides as primers in a PCR reaction (see AAQ12788 and AAQ12789). Other viruses which can be identified include Japanese encephalitis virus and yellow fever virus. All the dengue 2 virus proteins are encoded from an uninterrupted genomic sequence. N;Contains: envelope protein E; membrane-associated protein M; nonstructural protein NS1
C;Species dengue virus type 1
C;Date: 30-Sep-1993 #sequence_revision 30-Sep-1993 #text_change 31-Dec-2004
C;Accession: JQ1405

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        genome polyprotein - dengue virus type 1 (strain Western Pacific) (fragment)
Kontains: capsid protein C; envelope protein B; membrane-associated protein M; nonstruc
C;Species: dengue virus type 1
C;Date: 31-Mar-1990 #sequence_revision 31-Mar-1990 #text_change 31-Dec-2004
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 C;Accession: A27032
